Authorization for this examiner's amendment was given in a telephone interview with Dicran Halajian on 12/17/2008.

Claims 1-9 have been rewritten as follows:

1. (rewritten) A device for recording information on a record carrier of a writable type by writing the information on a track on a recording layer of said record layer via a beam of radiation, said recording layer comprising a pre-track pattern indicating the position of the track, the device comprising:

a head for providing the beam of radiation;
recording means for recording the information with the beam of radiation from the head in the track according to a predefined recording format for constituting a recording area

Art Unit: 2627

containing user data preceded by a lead-in zone located at the start of the recording layer and followed by a lead-out zone located at the end of the user data; wherein said recording means cooperate with the head for said recording of the information; a lead-out means included in said recording means for finalizing the record carrier for playback on a reading device that cannot detect the pre-track pattern, the finalizing comprising determining if data written in the recording area extends up to a predefined physical position, and, if not, recording lead-out information with the recording means, and, if the data extends at least up to the predefined position, not recording any lead-out information.

2 (rewritten) The device as claimed in claim 1, wherein the lead-out means are arranged for said determining using as the predefined physical position a prescribed radial position prescribed in said predefined recording format, the recording format being DVD and the prescribed physical position being 35.0 mm.

3 (rewritten). The device as claimed in claim 1, wherein the lead-out means are arranged for said determining using as the predefined physical position a minimal radial position substantially less than a prescribed radial position prescribed in said predefined recording format, the recording format being DVD and the minimal position being 29.0 mm.

4 (rewritten). The device as claimed in claim 1, wherein the lead-out means are arranged for said recording lead-out information starting at the end of the user data and ending at the predefined physical position.

5 (rewritten). The device as claimed in claim 1, wherein the lead-out means are arranged for recording dummy information as said recording lead-out information, the dummy information being formatted as user data.

6 (rewritten). The device as claimed in claim 1, wherein the lead-out means are arranged for recording dummy information as said recording lead-out information up to the predefined physical position, the dummy information being formatted as user data, and the recording being performed in a background mode in between recording of user data.

7 (rewritten). The device as claimed in claim 1, wherein the lead-out means are arranged for said determining if data written in the recording area extends up to a predefined physical position by retrieving a last written address parameter from the record carrier, which last written address parameter indicates a last sector number of a contiguously recorded part of the recording area starting from the start of the recording area.

Art Unit: 2627

8 (rewritten). A method of recording information on a record carrier of a writable type by writing marks in a track on a recording layer of said record carrier via a beam of radiation, the recording layer comprising a pre-track pattern indicating the position of the track, the method comprising the step of:

recording the information in the track according to a predefined recording format for constituting a recording area containing user data preceded by a lead-in zone located at the start of the user data and followed by a lead-out zone located at the end of the user data; and

finalizing the record carrier for a playback performed by a reading device that cannot detect the pre-track pattern, the finalizing comprising determining if data written in the recording area extends up to a predefined physical position, and, if not, recording lead-out information, and, if the data extends at least up to the predefined position, not recording any lead-out information.

9 (rewritten). A computer program product stored on a recordable medium for recording information, which program is operative to cause a processor of a computer to perform the steps of:

recording the information in the track according to a predefined recording format for constitutional a recording area containing user data preceded by a lead-in zone located at the start of the recording layer and followed by a lead-out zone located at the end of the user data; and

finalizing the record carrier for playback performed by a reading device that cannot detect the pre-track pattern, the finalizing comprising determining, if data written in the recording area extends up to a predefined physical position, and, if not, recording lead-out information, and, if the data extends at least up to the predefined position, not recording any lead-out information.
